Public Reporting of time synchronization event for the period:
July 1, 2012, 00:00:00 UTC - July 1, 2012, 07:30:00 UTC

The DigiStamp SecureTime system did not prepare itself for the leap second adjustment made to Coordinated Universal Time (UTC). The direct result of this event is that timestamps may imprecisely describe their time of creation by greater than the +/- one second imprecision allowed by our public TSA policy. Because of the audited and restricted clock adjustment methods used to ensure SecureTime, this potential inaccuracy may have persisted for several hours as the internal clocks of the TSAs resynchronized with UTC.

Because all clock adjustments are internally recorded in an audited adjustment trail by the DigiStamp TSAs it is likely that a fully accurate (to the tolerances specified in our policies) time for timestamps created during this period of imprecision could be discovered. Accomplishing this precision however, would, for timestamps produced during this period, be far more difficult than DigiStamp intends.

Timestamps created during the out-of-policy period are still valid; however, the timestamp certificate itself cannot assuredly claim precision to within one second of UTC.

DigiStamp is exploring new policies to prepare for leap seconds in the future.

We apologize for any inconvenience.
